

## PROJECT DOCUMENTATION

**AIM:** To make the analysis easy for the viewers in the Travel and Tourism of India.

### **PROJECT DETAILS:**

Data-Usage: The data was collected from data.gov.in. Since the data is very small, three datasets are connected to each other.

Tourism-Male and Female: There are different countries visiting India. Among them there will be men and women. To represent this, I used the bar graph. The data is such a huge to understand. So, I have created bar-graph to show the male count and female count from different countries. From the visualization creation, it would be easy to describe the count of them from particular country.

Tourism-Airports: To display this data, I used the maps. So that we'll be able to find the locations.

Tourism-Ages: Since it is related to ages, I have represented the ages in one of my sheets.

**RESOURCES:** data.gov.in, Tableau E-learning.

**CONCLUSION:** Male tourists are more than the Female tourists.

Hyderabad airport is highly preferable.

15-34 year tourists love travelling.
